VIGIL

Bun & NPM security layer

WHAT IT DOES

Vigil is a security policy engine and CLI wrapper around Bun and npm that inverts the traditional package manager model from trust-by-default to deny-by-default, audit-to-allow. It runs pre-flight security checks on every package before installation and verifies content hashes post-install.

COMMANDS

```
vigil init
vigil init --package-manager npm
vigil import                          ← import existing
vigil import --include-dev
vigil import --npm                    ← use npm install
vigil install [package]               ← mushiple ok
vigil install [package] --dev
vigil install [package] --optional
vigil trust [package] --allow postinstall
vigil trust [package] --allow inactivity
vigil update [package]
vigil remove [package]
vigil verify
vigil audit log
vigil audit log --package [package]
vigil audit log --event install
vigil audit log --last 20
vigil audit verify
```

AUDIT

CONFIG

```
package_manager = "bun"   ← Now npm
[policy]
min_age_days = 7
block_postinstall = true
transitive_age_gate = true
inactivity_days = 180
transitive_velocity_check = true
allow_prerelease = false
```

Must block

```
[bypass]
allow_fresh = ["@my-org/internal-lib"]
allow_postinstall = ["esbuild"]
allow_inactivity = []
```

trust

```
[blocked]
packages = ["malicious-pkg", "abandoned-utility"]
```

always deny

Changes here to config require a new hash with vigil install

- Shows drop free
- Hashes
- Why installed when
- Attempts to detect tampering.
